EXHIBITS	– Storm Water Management Design
APPENDIX ‘A’	– EPA SWMM v5.1 – Output Files
APPENDIX ‘B’	– Hydrodome HD8 Sizing Calculations & Schematic

## **1. PRE-DEVELOPMENT CONDITIONS**

### **1.1 LOCATION**

The proposed Volta Estate Winery development is located at 17945 Loyalist Parkway, Rosehall, which is south of the Greer Road and Loyalist Parkway intersection in the County of Prince Edward, ON.

### **1.2 DRAINAGE PATTERN**

The current drainage path for the site consists of overland sheet flow to Hubbs Creek. As such, the proposed stormwater management controls will ensure the storm flows are controlled to the pre-development flow rate to Hubbs Creek.

## **2. PROPOSED WORK**

### **2.1 GRADING**

The objective of the design is to utilize the existing natural slope and achieve the minimum and maximum slopes in the grading of the asphalt surfaces. This will ensure the surface not only drains as per the design but is not too steep. The grading of the site also ensures that the storm water flow will mostly drain through the onsite drainage system for storm water quantity and quality controls. The proposed drainage system onsite has been designed according to the five and one-hundred-year storm events as per the City of Belleville intensity-duration-frequency curve.

### **2.2 DRAINAGE**

The proposed design requires 1 catchbasin, 2 storm manholes, 113.6m of piping, 283.0 meters of flat bottom swale, a Hydrodome HD8 oil and grit separator and a combined fire/ stormwater management pond.

## **3. DESIGN CONSIDERATIONS**

### **3.1 PRE-DEVELOPMENT SITE DRAINAGE**

#### **3.1.1 Peak Runoff**

The total drainage area for the development is 21.748 hectares with an existing runoff coefficient of 0.26 based on the existing roof, asphalt, and agricultural field / grass surfaces. Due to the significant size of the drainage area, the airport formula is used to determine the time of concentration as per the following formula:

Airport Formula

$$T_c = (3.26 * (1.1 - C) * (L^{0.5})) / (S_w^{0.33})$$

T<sub>c</sub> = Time of Concentration (minutes)      L = Watershed Length (metres)  
 C = Runoff Coefficient (Dimensionless)      S<sub>w</sub> = Watershed Slope % (m/m)

Using the Rational Method, the peak flow rates are  $Q = \frac{CiA}{360}$

Subcatchment	Description	Draining to	Area, ha	T <sub>c</sub> , min
Area.1	Sheet	Hubbs Creek	21.748	284.02
<b>5-year Storm</b>				
A,ha	C	i,mm/h	Q, L/s	
Area.1	21.748	0.29	10	146.6
<b>100-year Storm</b>				
A,ha	C	i,mm/h	Q, L/s	
Area.1	21.748	0.29	16	242.7

Therefore, the total pre-development for the subject site is 146.6 L/s for the five-year storm and 242.7 L/s for the one-hundred-year storm.

3.1.2 Quantity

There is no known storm quantity control measure in place for the pre-development condition.

3.1.3 Quality

There is no known storm quality control measure in place for the pre-development condition.

3.2 POST-DEVELOPMENT SITE DRAINAGE

3.2.1 Peak Runoff

The proposed Del Degan Winery development consists of the construction of three new buildings, asphalt laneway & parking areas and grass areas. The resulting runoff coefficient in the post-development condition of the site is 0.29.

The proposed development will drain through the proposed onsite storm drainage system and shall discharge to the existing ditch which eventually drains to the Hubbs Creek watercourse.

The proposed drainage system is designed according to the 5-year minor storm and the 100-year major storm. Utilizing the airport formula, the time for storm water to flow from the farthest drainage area to Hubbs Creek, as outlined in Exhibit #1, is calculated to be 279.37 minutes.

Using the Rational Method, the peak flow rates are as follows:

Subcatchment	Description	Draining to	Area, ha	Tc, min
Pond	Sheet Flow	Swale	4.273	144.46
Swale	Channel Flow	Area.1	2.618	201.48
Area.1	Sheet / Channel	Hubbs Creek	14.857	279.37
<b>5-year Storm</b>				
5-year Storm	A,ha	C	i,mm/h	Cumulative Q, L/s
Pond	4.273	0.38	15	71.8
Swale	2.618	0.26	12	94.3
Area.1	14.857	0.27	10	201.1
<b>TOTAL</b>	<b>21.748</b>	<b>0.29</b>		
<b>100-year Storm</b>				
100-year Storm	A,ha	C	i,mm/h	Cumulative Q, L/s
Pond	4.273	0.40	25	119.0
Swale	2.618	0.26	20	156.2
Area.1	14.857	0.27	16	333.0
<b>TOTAL</b>	<b>21.748</b>	<b>0.29</b>		

Therefore, the total post-development flow for the subject site is 201.1 L/s for the five-year storm and 333.0 L/s for the one-hundred-year storm. The flows and other design information are contained in Exhibit #1 for the five-year storm and Exhibit #2 for the one-hundred-year storm at the end of the design brief.

### 3.2.2 Quantity

The post-development storm water runoff to Hubbs Creek is higher than the pre-development runoff. As such, storm water detention is required to ensure that the existing watercourse does not surcharge as a result of the proposed development.

Stormwater quantity controls for the site will be achieved by utilizing a 100mm diameter orifice pipe at the combined fire / stormwater management pond outlet. The orifice pipe will ensure the post-development runoff is controlled to the pre-development runoff rate for the five and one-hundred-year storm events. The resulting 542m<sup>3</sup> volume generated from the five-year storm and 877m<sup>3</sup> volume generated from the one-hundred-year storm will be contained within the proposed fire / stormwater management pond.

The storage volume for the five and one-hundred-year storms are calculated using EPA SWMM v5.1 software (Refer to Appendix 'A' for EPA SWMM v5.1 – Output Files)

The following table summarizes the pre-development, the post-development uncontrolled flow rates and the post-development-controlled flow rates for the subject site:

	<b>Pre- Development (L/s)</b>	<b>Post- Development Uncontrolled Flow Rate (L/s)</b>	<b>Post- Development Controlled Flow Rate (L/s)</b>
<b>5-year Storm</b>			
<b>TOTAL</b>	146.6	201.1	144.5
<b>100-year Storm</b>			
<b>TOTAL</b>	242.7	333.0	233.5

The orifice pipe sizing and subsequent storage volume for the detained flow are indicated in Exhibit #3 for the five -year storm and Exhibit #4 for the one-hundred-year storm at the end of the design brief.

The proposed combined fire / stormwater management pond has also been designed with a permanent pool volume to provide fire flow storage on-site. The calculations provided in the “Fire Protection Water Supply Guideline for Part 3 in the Ontario Building Code” by Office of the Fire Marshal were used for the fire flow analysis. As such, the proposed winery volume is used in the fire flow calculations. The minimum fire protection water supply shall not be less than what is needed to provide the minimum flow rate for a duration of 30 minutes as per the Office of the Fire Marshal Guidelines. Therefore, the flow rate for fire protection is determined to be 9000 L/min with a minimum fire flow storage of 270.0 m<sup>3</sup> and a calculated fire flow storage requirement of 439.5 m<sup>3</sup>.

The proposed combined fire / stormwater management pond has a total permanent pool volume of 471.34 m<sup>3</sup> considering the reduction in storage volume from the 600mm ice depth allowance and the 200mm clearance from the dry hydrant intake pipe to the bottom of the pond.

The fire pond storage volume and sizing calculations are indicated in Exhibit #5.

### 3.2.3 Quality

The storm water collected in the proposed development passes through a HydroDome HD8, which achieves a total suspended solids removal of at least 84%. This value is greater than the required ‘Enhanced’ treatment of 80% as indicated in the MOE Stormwater Management Planning and Design Manual, dated March 2003 (refer to Chapter 3: Environmental Design Criteria, Section 3.3.1.1. Level of Protection). The design calculations from the manufacturer as well as the drawings for the unit are included in Appendix ‘B’ of this report.

Additionally, the combined fire / stormwater management pond will aid to further improve the water quality from the site due to the permanent pool volume and the rip-rap at the spillway inlets to the pond.

### 3.2.4 Maintenance Recommendations

The storm sewer system includes swales and a combined fire / stormwater management pond. It is important to regularly inspect the elements to ensure that storm water is flowing as originally designed. Debris and sediment commonly clog the system and reduce the overall effectiveness.

The following maintenance and inspection tasks should be done:

1. Inspect the culverts for structural integrity. (Annually) Check culvert pipes for structural integrity to ensure they aren't crumbling or broken.
2. Conduct routine inspections for trash or other debris that may be blocking the culvert pipes, swales and combined fire / stormwater management pond. (Monthly and after rain events) Remove all trash and debris.
3. Conduct routine inspections for erosion of the combined fire / stormwater management pond and swales. (Annually and after rain events). Any erosion shall be corrected by sodding the area. There may be a need to provide further erosion control (ie rip-rap) to prevent the re-occurrence of erosion.
4. If there is a visible accumulation of sediment in the bottom of the pond or around the high-water line of the pond, then removal of sediment accumulation is required.
5. Conduct routine maintenance of swales and pond including grass cutting.
6. The frequency of grass cutting correlates on the surrounding land uses, and ultimately local municipal by-laws. Grass cutting should be done as infrequently as possible recognizing the aesthetic concerns of nearby residents. Grass around wet facilities should not be cut to the edge of the permanent pool.
7. As a safety precaution, grass cutting should be done parallel to the shoreline with grass clippings being ejected upland to reduce the potential for organic loadings to the pond.
8. Inspect for sediment accumulation at pipes (Semi-annually and after rain events). It is important to clean out sediment that might be restricting water flow.
9. Do not dump any materials in the storm system.
10. Inspect the Hydrodome Oil/Grit Separator (Annually). Procedures for inspection are provided in the Hydrodome Owner's Manual. A vacuum truck is to be used for maintenance of the Hydrodome.

#### 4. CONCLUSION

The aforementioned calculations and recommendations for the storm drainage system are based on the current design for the site as of writing this report.

We trust this report meets your approval. Please contact the undersigned should you have any questions or comments.

Yours truly,

Site Discharge	Flow	Adj. Flow (w/o Surface Runoff)	Total Storm Volume
	(m <sup>3</sup> /s)	(m <sup>3</sup> /s)	(m <sup>3</sup> )
Pre - Develop.	0.2427	0.0286	<del>877.0</del>
Post - Develop.	0.3330	0.1190	877.0

**Control Node Data**

Outlet Pipe	Storm Control Node	Outlet Pipe Size	Outlet Invert Elev.	Elev. @ Orifice
		(m)	(m)	(m)
1	Pond 1	0.100	87.40	87.45

\* Volume calculated using SWMM 5.1 modelling software in accordance with the flow rate for actual size of the orifice.

**Head Height**

0.49 m

**Storm Retention Elev. Check**

**87.94 m**

**Pond Storage**

Pond Sections	Pond Dimensions		Storage Volume
	Depth	Avg Area	
	(m)	(m)	(m <sup>3</sup> )
Pond	0.540	1628.30	879.28
<b>Total</b>	<del>0.540</del>	<del>1628.30</del>	<b>879.28</b>

<b>Total Storage =</b>	<b>879.3 m<sup>3</sup></b>	<b>Required Storage Achieved</b>
------------------------	----------------------------	----------------------------------

**Orifice Diameter Calculation (A=Q/(Cd\*sqrt(2\*g\*h)))**

Coefficient of Discharge	Cd = 0.8 (tube)	0.62 Sharp Orifice coefficient of discharge
Allowable Flow Rate	Q = 0.0286 m <sup>3</sup> /s	0.80 Tube coefficient of discharge
Force of Gravity	g = 9.81 m/s/s	
Head Height	h = 0.49 m	
Dia of Max. Orifice	dia = 121.27 mm	Use - 100 mm

**Flow Rate for Actual Size of Hole (Q=Cd\*A\*sqrt(2\*g\*h))**

Area of Orifice	A = 0.0079 m <sup>2</sup>
Flow Rate through Orifice	Q = 0.0195 m <sup>3</sup> /s

**Volta Estate Winery**  
**Exhibit #5: Fire Pond Volume Calculations**

2024-11-29  
 Job: 220526

Required Minimum Water Supply Flow Rate for Fire Protection  
 (As required determined by the Office of the Fire Marshal Guideline - OFM-TG-03-1999)

Prop. Building Area	2,947	m <sup>2</sup>
Prop. Building Height	7.85	m
Prop. Building Volume	23,134	m <sup>3</sup>

**Total Volume** 23,134 m<sup>3</sup>

Water Supply Coefficient (K) 19 F-3 Occupancy as per OBC matrix provided by Giannone Petricone Associates Inc.

Spatial Coefficient (S) 1

Total Minimum Water Supply 439,545 L

The calculated Q is greater than 270,000 L therefore the required minimum water supply for fire protection is 9000 L/min (as per Table 2 in the Office of the Fire Marshal Guideline).

**Fire Pond Sizing**

**Minimum Storage Required** 439.5 m<sup>3</sup>

Side Slopes	2.5	:1
Water Depth	1.2	m
Intake Pipe Offset from Pond Bottom	0.2	m
Ice Depth Allowance	0.6	m
D = Water Depth Above Intake Pipe	0.4	m

A<sub>ice</sub> = Pond Area @ Ice Depth 1,258.8 m<sup>2</sup>

A<sub>pipe</sub> = Pond Area @ Intake Pipe 1,097.9 m<sup>2</sup>

$V = (A_{pipe} * D) + ((A_{ice} - A_{pipe}) * D/2)$

<b>Total Volume =</b>	<b>471.34</b> m <sup>3</sup>	<b>Required Storage Achieved</b>
-----------------------	------------------------------	----------------------------------

# **APPENDIX 'B'**

HydroDome HD8

Sizing Calculations and Schematic

## **Hydroworks Sizing Summary**

**Del Degan Winery**

**17944 Loyalist Pkwy-Wellington**

**08-23-2024**

### **Recommended Size: HydroDome HD 8**

Hydroworks Sizing Program Version 5.8.5

**A HydroDome HD 8 is recommended to provide 80 % annual TSS removal based on a drainage area of 4.26 (ha) with an imperviousness of 38 % and St. Catherines A, Ontario rainfall for the ETV particle size distribution (Calgary).**

**The recommended HydroDome HD 8 treats 100 % of the annual runoff and provides 84 % annual TSS removal for the St. Catherines A rainfall records and ETV particle size distribution (Calgary).**

**The HydroDome has a siphon which creates a discontinuity in headloss. The given peak flow of .113 (m<sup>3</sup>/s) is less than the full pipe flow of .14 (m<sup>3</sup>/s) indicating free flow in the pipe during the peak flow assuming no tailwater condition. Partial pipe flow was assumed for the headloss calculations. The headloss was calculated to be 264 (mm) above the crown of the 300 (mm) outlet pipe.**

**This summary report provides the main parameters that were used for sizing. These parameters are shown on the summary tables and graphs provided in this report.**

**If you have any questions regarding this sizing summary please do not hesitate to contact Hydroworks at 888-290-7900 or email us at [support@hydroworks.com](mailto:support@hydroworks.com).**

The sizing program is for sizing purposes only and does not address any site specific parameters such as hydraulic gradeline, tailwater submergence, groundwater, soils bearing capacity, etc. Headloss calculations are not a hydraulic gradeline calculation since this requires a starting water level and an analysis of the entire system downstream of the HydroDome .

## Other Parameters

The screenshot shows the 'Hydroworks Siphon Separator Sizing Program - HydroDome' window. The 'Other' tab is selected, displaying several parameter groups:

- Scaling Law:**
  - Peclet Scaling based on diameter x depth
  - Peclet Scaling based on surface area (diameter x diameter)
- HydroDome Design:**
  - High Flow Weir
  - Flow Control (parking lot storage)  
Must add Quantity Storage Table
- TSS Removal Extrapolation:**
  - Extrapolate TSS Removal for flows lower than tested
  - No TSS Removal extrapolation for flows lower than tested
  - No TSS Removal extrapolation for lower flows or inter-event periods
- Lab Testing:**
  - Use NJDEP Lab Testing Results
  - Use ETV Canada Lab Testing Results
- HD Hydraulics:**
  - HD Model: HD 8
  - Custom Insert Size
- TSS Removal Results:**
  - Required TSS Removal
  - Choose Model #
  - TSS Removal Required:**
    - TSS Removal (%):
    - Enter required TSS Removal (%)

## Flagged Issues

If there is underground detention storage upstream of the HydroDome please contact Hydroworks to ensure it has been modeled correctly.
